

Space Maintainer Care

Your child has had a fixed type of space maintainer placed today. This device is made to hold or “maintain” the available space until the permanent tooth underneath erupts. We shall check it on subsequent routine six (6) month visits.

Fixed or cemented appliances are cared for through normal tooth brushing and flossing. Extremely hard, brittle, and sticky foods are to be avoided as they may loosen the space maintainer. Loose appliances must be re-cemented as soon as possible to prevent breakage or decay underneath.
